1. Introduction

Purpose

This document defines the business requirements for the **Small Business Order & Inventory Management System**.

The purpose of the system is to provide a centralized solution for managing customer orders, products, inventory, and basic business information.

2. Business Background

Small businesses often manage customer orders using WhatsApp, telephone calls, notebooks, or Excel spreadsheets. Inventory information is also frequently maintained manually.

As the number of products and orders increases, managing these activities manually becomes difficult and can lead to inaccurate information and delays.

Therefore, a centralized system is proposed to improve order and inventory management.

3. Problem Statement

The current manual process creates the following problems:

- Orders may be missed or recorded incorrectly.
- Staff need to check stock manually.
- Inventory records may be inaccurate.
- Order status is difficult to track.
- Customer information and order history are not centralized.
- Low-stock products may not be identified on time.
- Preparing sales information requires manual effort.

4. Business Objectives

The system aims to:

1. Centralize order and inventory information.
2. Reduce manual work in order management.

3. Improve inventory accuracy.
4. Allow staff to quickly check product availability.
5. Provide better visibility of order status.
6. Alert users when products reach their minimum stock level.
7. Maintain customer and order history.
8. Provide basic sales and inventory information.

5. Stakeholders

Table 1: Stakeholder responsibilities

Stakeholder	**Interest / Responsibility**
Business Owner	Monitor business performance, sales and inventory
Admin	Manage products, users and business information
Sales Staff	Create and manage customer orders
Inventory Staff	Monitor and update stock
Customer	Place orders and receive order information

6. Current AS-IS Process

Current Business Process

Customer places an order through WhatsApp / Phone

↓

Staff receives the order

↓

Staff checks stock manually

↓

Order is recorded in notebook / Excel

↓

Order is confirmed

↓

Order is prepared

↓

Stock is manually updated

↓

Order is completed

Current Pain Points

- Manual stock checking
- Manual order recording
- Risk of incorrect or missing orders
- Difficult order tracking
- No centralized customer history
- Manual identification of low-stock products

7. Proposed Solution

A centralized **Small Business Order & Inventory Management System** will be introduced.

The system will allow authorized users to:

- Manage products
- Manage inventory
- Manage customers
- Create and manage orders
- Check product availability
- Track order status
- Receive low-stock alerts
- View basic sales and inventory information

8. Proposed TO-BE Process

Customer places an order

↓

Staff enters order into the system

↓

System checks stock availability

↓

Stock available?

Yes → Order is created → Stock is updated → Order is processed

No → System displays insufficient-stock message

↓

Order status is updated

↓

Order is completed

↓

System checks stock level

↓

Stock reaches minimum level?

↓

Low-stock alert is shown to authorized users

9. Business Requirements

Table 2: Business requirements

ID	Business Requirement	Priority
BR-01	The system should allow authorized users to manage product information.	High
BR-02	The system should allow authorized users to view and update inventory information.	High
BR-03	The system should allow staff to create and manage customer orders.	High
BR-04	The system should check product availability before confirming an order.	High
BR-05	The system should allow staff to track and update order status.	High
BR-06	The system should maintain customer information and order history.	Medium
BR-07	The system should provide low-stock alerts when inventory reaches the minimum stock level.	High
BR-08	The system should provide basic sales and inventory information to the business owner.	Medium
BR-09	The system should restrict access to functions based on user roles.	High

10. Business Rules

Table 3:Businsess rules

ID	Business Rule
BRULE-01	An order cannot be confirmed if the requested quantity exceeds available stock.
BRULE-02	Each product should have a defined minimum stock level.
BRULE-03	A low-stock alert should be generated when stock reaches or falls below the minimum stock level.
BRULE-04	Orders should have a defined status such as Pending, Processing, Completed, or Cancelled.
BRULE-05	Users should only access functions permitted by their assigned role.

11. Project Scope

In Scope

- User login and role-based access
- Product management
- Inventory management
- Customer management
- Order management
- Order status tracking
- Stock availability checking
- Low-stock alerts
- Basic sales information
- Basic inventory information

Out of Scope

- Online payment gateway
- Delivery tracking
- Advanced accounting
- Payroll management
- AI-based forecasting
- Multi-branch management

12. Assumptions and Constraints

Assumptions

- The business has authorized users who will operate the system.
- Product and inventory information will be maintained by authorized staff.
- The system will initially support a single business.
- Users will have access to an internet-connected device.

Constraints

- Limited project development time
- Limited access to real business data
- Advanced third-party integrations are outside the initial scope

13. Success Criteria

The project will be considered successful when:

- Staff can create and manage orders digitally.
- Staff can check product availability quickly.
- Inventory information can be updated accurately.
- The system prevents orders when sufficient stock is unavailable.
- Low-stock products can be identified through alerts.
- Users can track order status.
- Customer and order information can be accessed centrally.
- The business owner can view basic sales and inventory information.
